

Development Documentation

Design

A separate **design-document** file can be found in the **/documents** folder in the root of my submission folder.

Construction

My code can be found in the **/server** folder in the root of my submission folder, coupled with the **app.js** file in the same location.

Database migrations and seed information can be found in the **/db** folder in the root of my submission folder.

Additional application configuration can be found in the **package.json** folder in the root of my submission folder.

Test

A separate **test-document** file can be found in the **/test** folder in the root of my submission folder.

Document

Limitations

I feel the structure of the add and edit views became bloated, having been built upon as the project progressed, and I would have liked to have heavily refactored them. The mechanism to identify form fields became cluttered and changing a reference in one location meant having to change it in a number of others.

Improvements

I would like feature tests to run against a test instance of the database that is cleared and re-seeded before each test so as to more easily test the functionality of the add and edit pages.

User Guide

Instructions on setting up the application to run locally can be found in the **README.md** file in the root of my submission folder.

Instructions on how to use the application itself can be found in video format in the **user-guide.mp4** file in the **/documents** folder in the root of my submission folder.
